1. The disclosure should be carefully reviewed and ensure that any and all grammatical, idiomatic, and spelling or other minor errors are corrected.
2. The subject matter of this application admits of illustration by a drawing to facilitate understanding of the invention. Applicant is required to furnish a drawing under 37 CFR 1.81(c). No new matter may be introduced in the required drawing. Each drawing sheet submitted after the filing date of an application must be labeled in the top margin as either "Replacement Sheet" or "New Sheet" pursuant to 37 CFR 1.121(d).

No drawing set is submitted in the application, there is only drawings can be found in the Certified Copy of Foreign Priority Application.

3. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claims 1-21 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Claims 1-21 are indefinite because in claim 1, "detection pulses" is not clearly understood, also "the length of the detection pulses" is not clearly either (i.e., have the pulses already been detected by the control input circuit, or are they to be detected?). Therefore, the definition of the detection pulses are suggested to added in the claims.

The function of the "constant current sink", whose current can be lowered, is also not clearly defined. For instance, the circuit arrangement provided in Fig. 4, with a reference "7" generates an upwardly limited output voltage from an input voltage. Moreover, in what terms of electrical characteristics (i.e., voltage, current, frequency ...) that the comparison in "the drawn current being lowered between two successive detection pulses" is taken place.

It is further not clearly understood "control signal S" which needs to be indicated by the evaluation module 15) The terminals 9, 11 of the circuit in Fig. 4 appears to carry the voltage U_{st} , while in Fig. 1 shows this to be the output signal of a voltage source. This output signal is intended to be applied to the control input circuit (6) on the basis of the presence of the control signal S. The evaluation module 15 shown in Fig. 4 does not rate the voltage U_a , thus, it is not clear that it indicates the control signal S.

Finally, there is no activated device (i.e., ON/OFF switching device) being recited in the claim, therefore "prescribed turn-on value" and "prescribed turned-on period" are inferentially recited.

4. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Matthew V. Nguyen whose telephone number is (571) 272-2081.
